

Struggling to brush your teeth due to limited hand movement?

The study is being conducted to collect user information on a specialized Colgate Assist Handle toothbrush.

We are seeking participants with hand movement limitations caused by arthritis, stroke, Parkinson's, Multiple Sclerosis, and other conditions. We plan on recruiting 26 participants ages 18-70 with impaired ability to perform daily tasks. Duration in the study will be approximately three weeks and consists of two in-person visits and two remote visits (four visits total). Participants who meet all inclusion criteria will receive study product at their second visit and will be asked to record themselves brushing their teeth and complete surveys. Participants will be compensated \$25 per visit, totaling no more than \$100 (for all four visits). Screen failures will be compensated \$25.
